

EXES on SOFIA

Matthew J Richter
UC Davis

with Mark McKelvey, Mike
Case, and Curtis DeWitt

- EXES is a PI instrument optimized for high spectral resolution in mid-IR
- High resolution mode:
 - cross-dispersed with $R = 50,000$ to $110,000$ depending on slit width
 - single setting coverage of $\sim 0.8\%$ with 4-40" long slit or $\sim 4\%$ with >1 " long slit
- Other modes
 - Medium single order: $R \sim 5,000$ to $20,000$
 - Low single order: $R \sim 1500$ to 4000
 - limited focal plane and pupil imaging
- Wavelength range $\sim 4.5 \mu\text{m}$ to $\sim 28.3 \mu\text{m}$
 - includes H_2 $J=2-0$, although detector response fading at that wavelength
- Detector is a 1024×1024 pixel Si:As optimized for low background

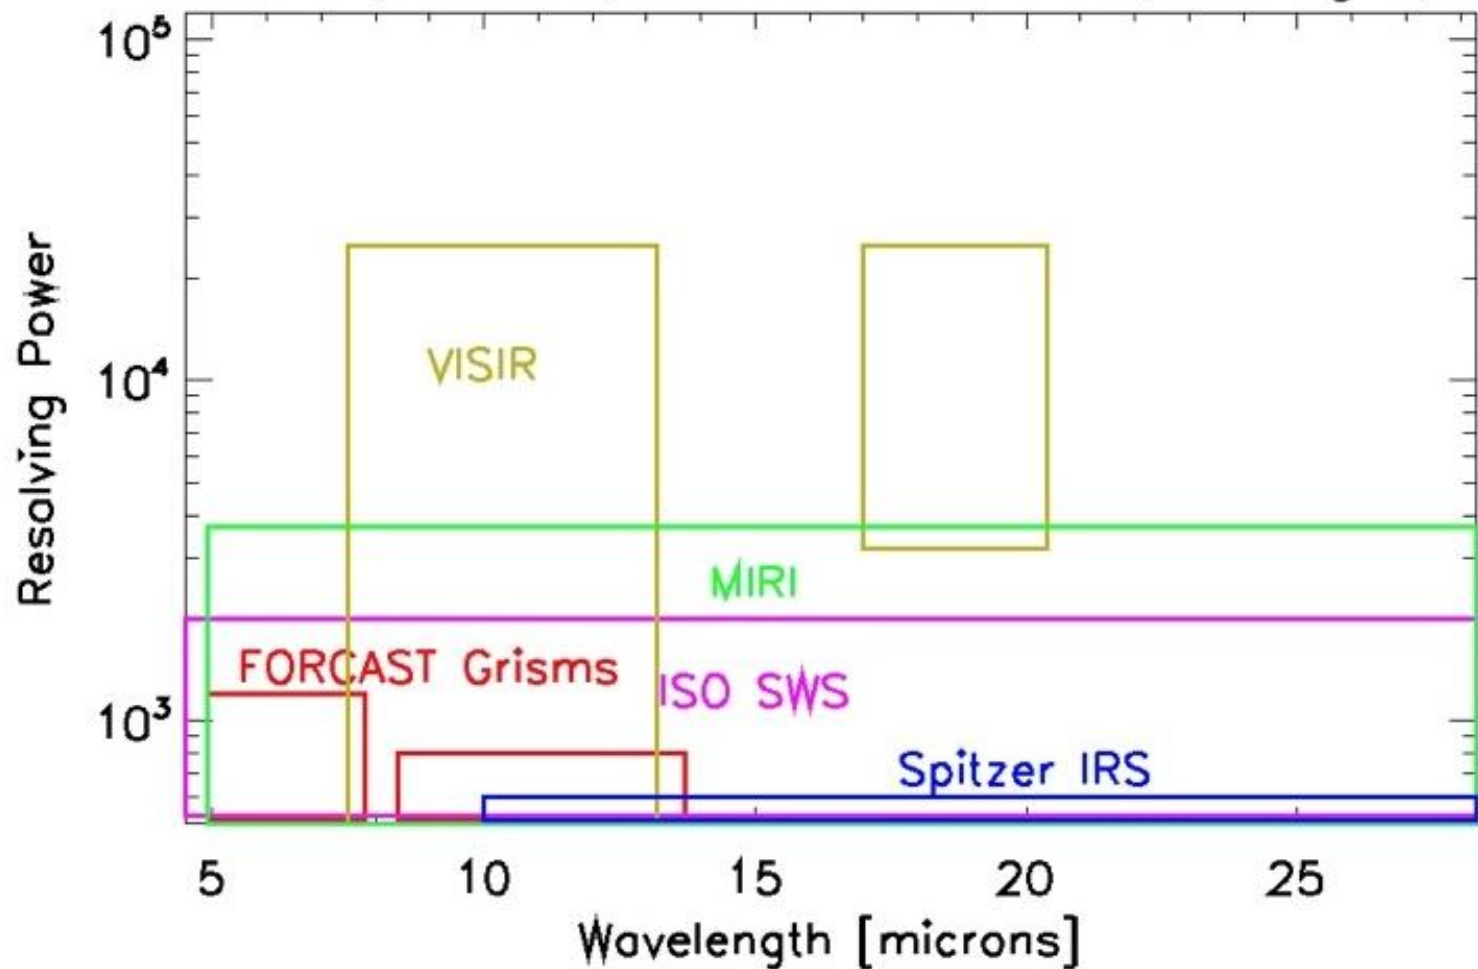

HIGH_MED Configuration

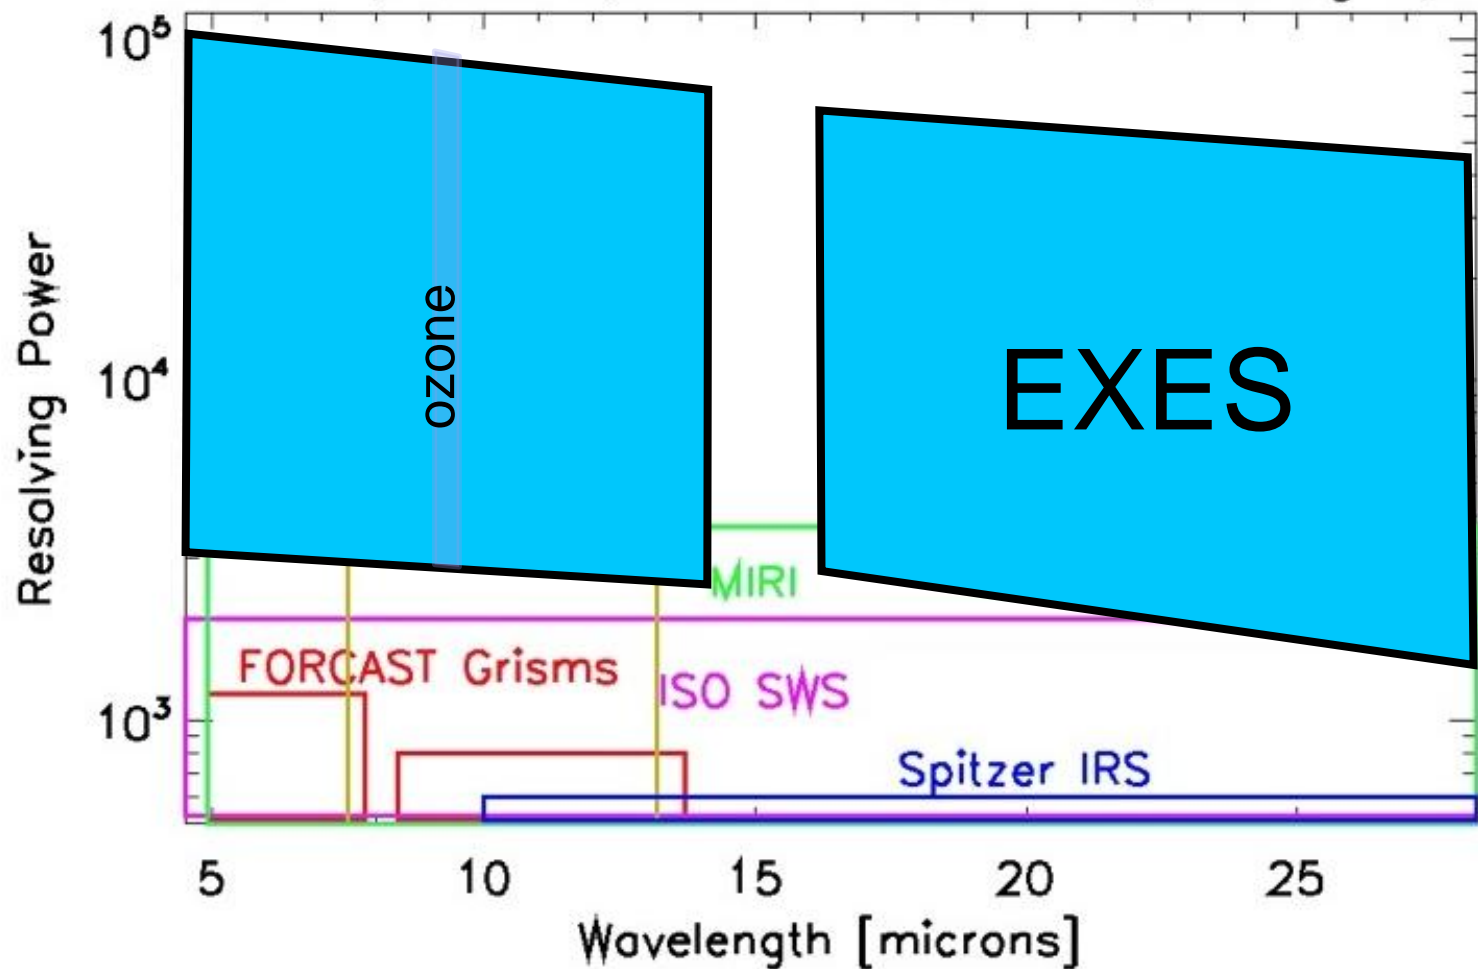

HIGH_LOW Configuration

ROUGH phase space for Mid-IR Spectrographs

ROUGH phase space for Mid-IR Spectrographs

Echelon grating

- 40" long
- 0.300" groove spacing
 - 0.131 grooves/mm
- 84.2 degree incidence angle
 - 0.03" groove height
- Diamond machined Al 6061
 - Hyperfine Inc

EXES flights

- 7 flights so far
 - 2 Flights in Apr 2014
 - 5 flights in Feb/Mar 2015
- Nod and map observations
- Most observations in 6-8 micron range in high resolution mode
 - What can be done from the ground should be done from the ground
 - 50% Mauna Kea transmission for point sources - TEXES on Gemini

5.4 km/s
↔

- Use sky lines with 6 different slits
- FWHM of Gaussian fits
 - 3 km/s to 5.4 km/s
- Titan spectra for further investigation

- H₂O lines in stars are weaker than expected based on 12 μm observations with TEXES
- First stars other than Sun explored at this wavelength range with this resolution

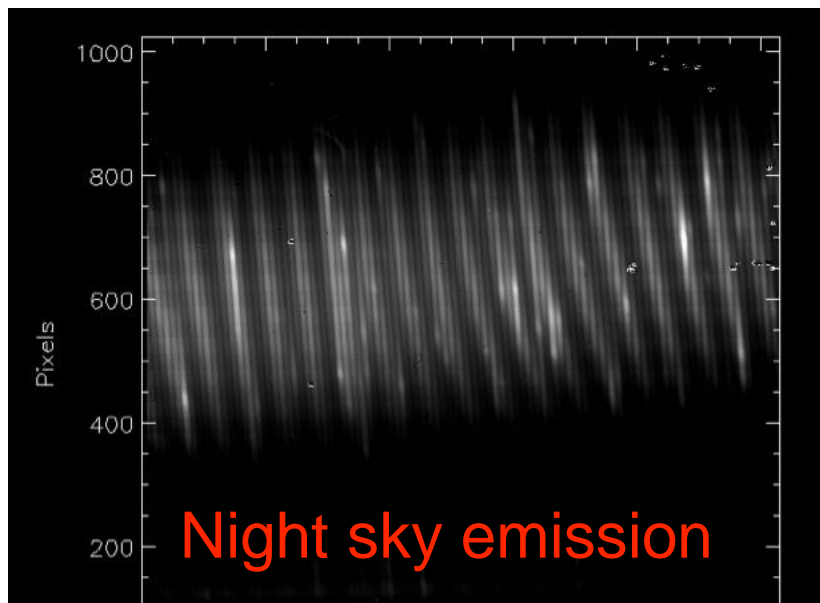

Ryde et al (in prep)

Jupiter H₂

- Use H₂ ortho-para ratio to study dynamics
 - Only possible with EXES/SOFIA
- EXES/SOFIA can produce data cubes
 - slit stepped across Jupiter
 - both maps done in single leg

H₂ maps of Jupiter and continuum at 17.03 microns (top) and 28.22 microns (bottom)

- Use low dispersion for cross-dispersion - **High_Low mode**
- large wavelength coverage at cost of short slit
- powerful tool for bright objects

VY CMa Survey

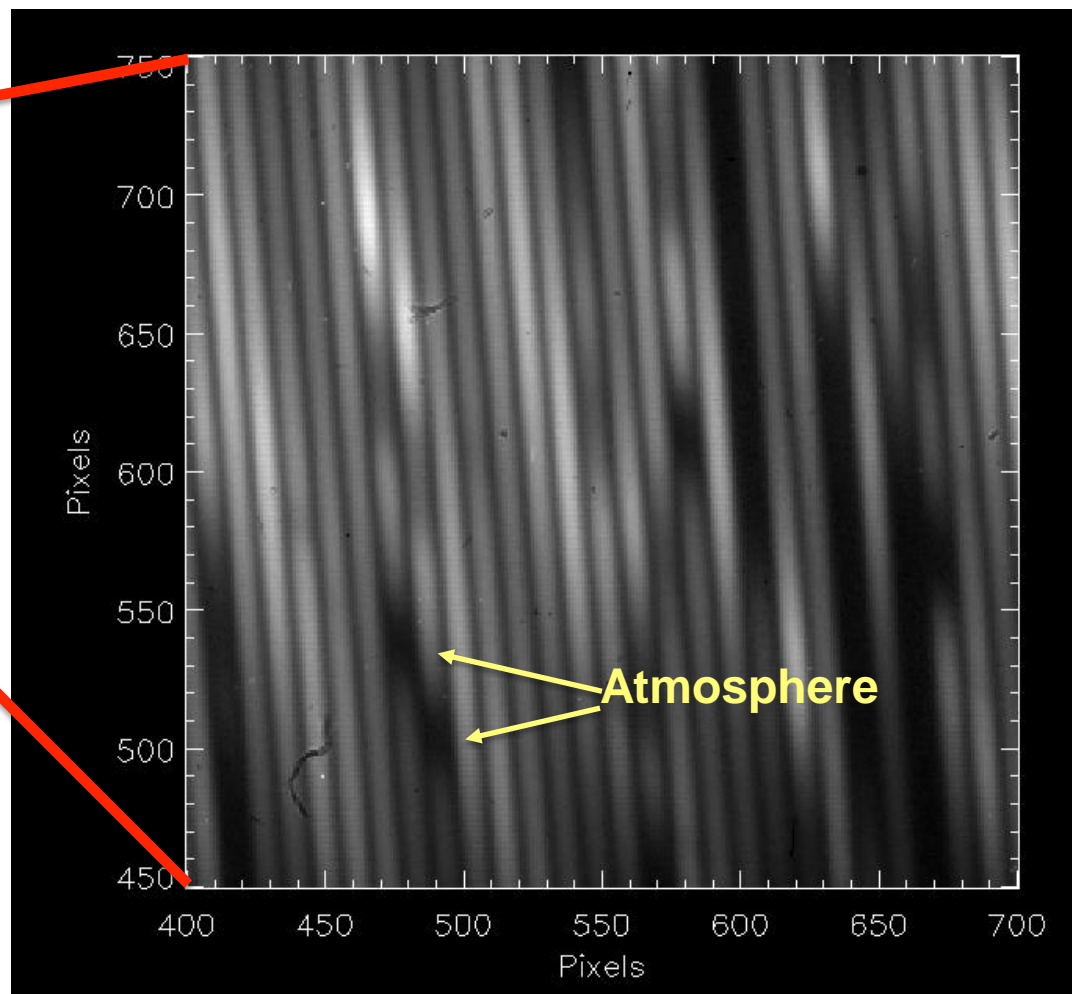

- Nod difference
 - atmosphere absorbs

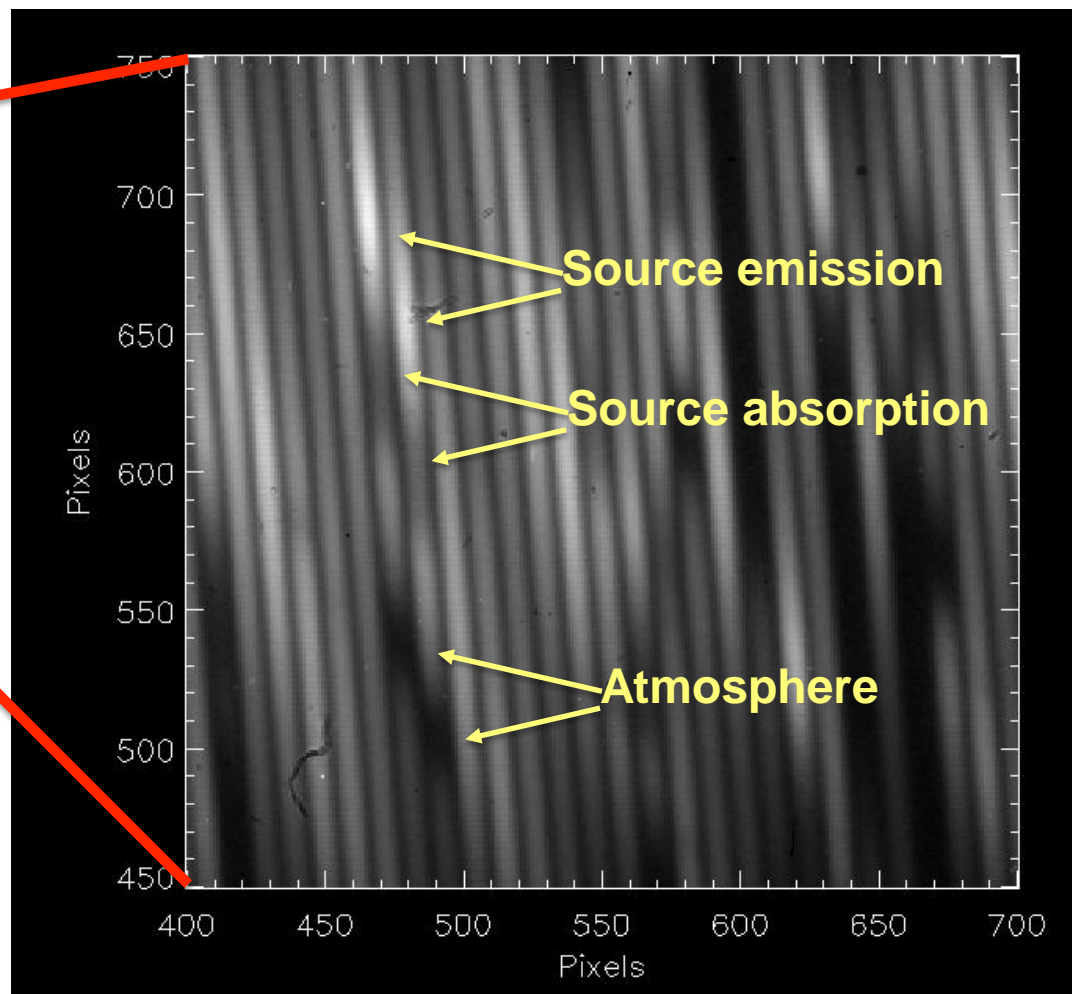

- Nod difference
 - atmosphere absorbs

VY CMa Survey

- Nod difference
 - atmosphere absorbs

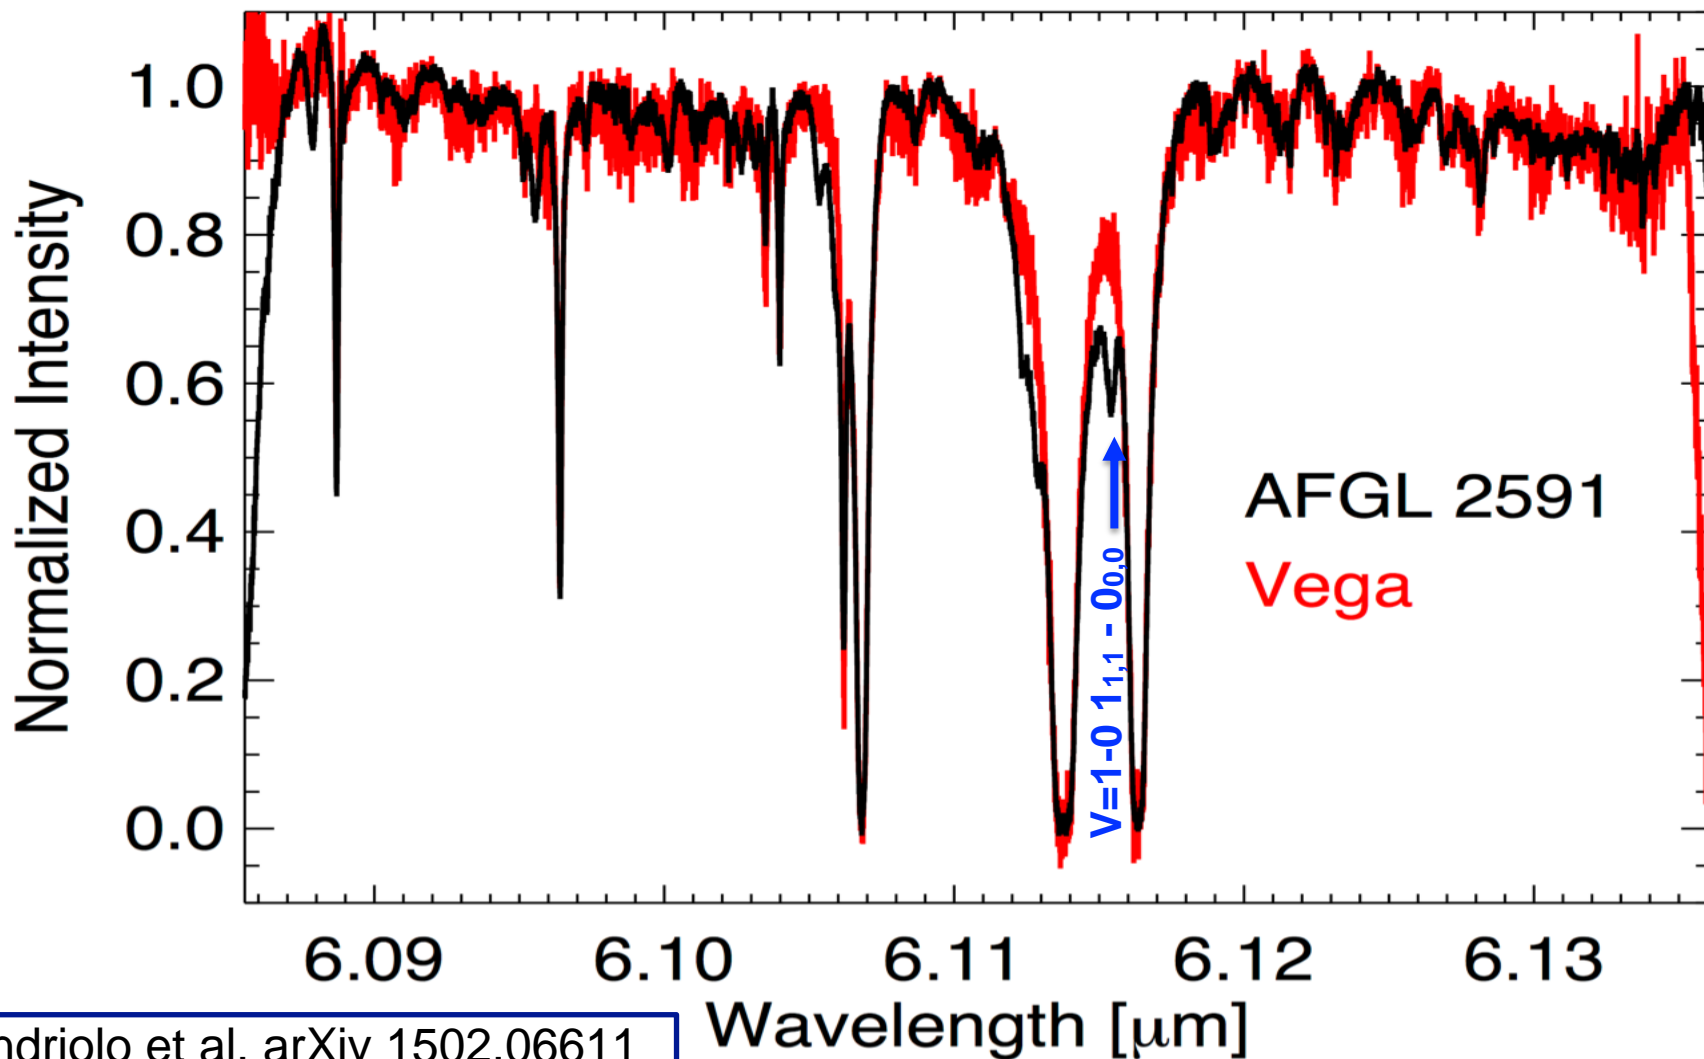

- Nod difference
 - atmosphere absorbs
 - P Cygni profiles

VY CMa Survey

- 80 minute leg
- completed 6 settings
 - 5.6 to 6.7 microns

Indriolo et al, arXiv 1502.06611
 Accepted to ApJ Letters

- 10 lines detected

- ground state of para-H₂O
- 1 H₂¹⁸O
- 2 2-1 lines

- Line profiles

- FWHM ~14 km/s
- blue-shifted

- T = 700 K

- N = 10¹⁹ cm⁻²

- EXES/SOFIA can separate target lines from strong atmospheric lines

- EXES/SOFIA can study absorption from the coldest H₂O gas

Summary

- EXES on SOFIA producing new science data
 - unseen combination of sensitivity and spectral resolution at wavelengths blocked from the ground
- Able to separate astrophysical lines from Earth's atmospheric lines with moderate Doppler shift
- Basic observing modes work
 - Still lots of work to be done....
